

Project Atlas - Product Brief

Version 3 | Internal working draft | 12 August

Atlas is a lightweight reporting workspace for small retail teams that currently move weekly sales data between spreadsheets, email, and point-of-sale exports.

Owner	Product
Pilot group	8 independent retail teams
Target release	15 September
Initial regions	Los Angeles and San Francisco

What is in the first release

- Weekly sales dashboard
- Store-level filters
- CSV export
- Email summary sent every Monday
- Basic role permissions for managers and analysts

Out of scope

Mobile applications, push notifications, inventory forecasting, and direct write-back to point-of-sale systems are not planned for the first release.

Success measures

For the pilot, the team will track weekly active use, time saved preparing the Monday sales report, and the number of manual spreadsheet hand-offs removed.

Known risks

The largest dependency is the Northwind POS export API. Security review is also required before pilot accounts can contain real customer data. The September 15 date assumes both items close on schedule.
